SUMMARY

Full-stack software engineer who builds scaled product systems, internal tools, and developer platforms across React, TypeScript, Python, Node.js, MySQL, PostgreSQL, Redis, Kafka, and Kubernetes. Experienced shipping real-time communication platforms used by 100k+ employees, optimizing high-volume data paths, and building LLM-based CI/CD tooling with GitLab MCP, agent skills, and vector search.

TECHNICAL SKILLS

Languages and Paradigms: Python, Java, C++, TypeScript, JavaScript, PHP, Shell scripting, Object-oriented design

Web, APIs and Frameworks: React, Redux Toolkit, Node.js, REST, GraphQL, Flask, HTML, CSS

AI: LLM Agents, Copilot CLI, Claude Code, Codex, MCP, Prompt Engineering, Agent Skills

Databases & Data Stores: MySQL, PostgreSQL, Elasticsearch, MongoDB, Redis

Systems and Infrastructure: Docker, Kubernetes, Apache Kafka, Distributed Systems

Tools: Splunk, Git, Jira, Confluence

WORK EXPERIENCE

Paycom

San Francisco, CA

Software Engineer

June 2024 - Present

- Built and scaled a Kubernetes-based employee communication platform used by 100k+ employees, owning features end-to-end across system design, REST APIs, MySQL data models, React/TypeScript dashboards, rollout, and production support followed by live site and DRI work during on-call rotations.
- Created developer tooling that used GitLab MCP and well-defined agent skills to read failed pipeline events, PR changes, build logs, and test output, then identify whether the issue came from code, tests, configuration, or infrastructure. Agent auto-fixes minor code changes, or creates and flags work items for infra issues which affect multiple PRs.
- Built remediation agents for common CI failures that generated small PR patches, reran validation checks, and commented on the PR with the root cause, fix summary, and next steps while keeping engineers as final approvers.
- Reduced database load by about 40% and improved peak-time responsiveness by integrating Redis Cache and a Kafka-based event-driven service to power real-time messaging dashboards and conversation updates.
- Optimized MySQL schema design and query performance for complex nested communication data, leveraging indexing and query optimization techniques to improve data retrieval speed by ~50% and support efficient backend operations.
- Built a scalable lookup service to replace expensive multi-table joins with batch-updated employee group mappings, cutting query latency and reducing the cost of repeated high-volume queries by ~60% across multiple core modules.
- Designed and implemented long-running jobs for bulk updates and scheduled communications using asynchronous queue-based processing, improving system reliability by off-loading heavy operations out of user-facing request flows.
- Developed REST APIs and microservices within an MVC framework, applying object-oriented design patterns and reusable service layers to deliver highly available, maintainable, and scalable solutions.
- Built responsive user interfaces for desktop and mobile using ReactJS, TypeScript, and Redux RTK, implementing reusable components and efficient state management while seamlessly integrating with backend APIs.
- Handled on-call responsibilities by debugging and resolving production issues through code reviews, internal dashboards, and Splunk queries, collaborating across teams to identify root causes and deliver timely fixes.

Paycom

Irving, TX

Software Engineer Intern

May 2023 – August 2023

- Developed a real-time chat feature which connects more than 37,000 clients with their specialists. Designed MySQL database for secure storage and optimized querying of multiple message threads and tracking history.
- Designed MySQL data models for secure message storage, thread management, and history tracking, enabling low-latency querying and supporting a reliable communication experience for a large user base.
- Implemented REST APIs using Node.js, Express, and Typescript. Leveraged Socket.io for instant messaging capabilities and delivered a user-friendly front-end using ReactJS.

VMware

Bangalore, India

Software Engineer

July 2020 – July

2022

- Built Python automation for the vSphere suite and integrated it with an internal language-agnostic framework, improving regression analysis coverage and helping teams identify build issues earlier in the release cycle.
- Leveraged Linux shell scripting and VMware's PowerCLI libraries to develop scripts for functional verification of licenses and features across multiple releases.
- Built automation workflows for NSX-T using REST APIs in Java, identifying about ~50% of the bugs for NSX platform.

VMware

Software Engineer Intern

Bangalore, India

January 2020 – July 2020

- Developed an internal tool using Python and Shell scripts to dynamically generate and execute test suites for custom upgrade/patch workloads. Track status and notify users with results on run completion, reducing hours of manual work.

Microsoft

Software Engineer Intern

Hyderabad, India

May 2019 – July 2019

- Built a pipeline flow to persist test results from applications running on Docker and displayed them on Azure DevOps platform using ReactJS.
- Implemented a clustering algorithm in C# to group related test failures and publish to Azure DevOps platform.

PROJECTS

CI Remediation Developer Tooling

Skills: TypeScript, Python, GitLab MCP, Copilot CLI, Codex, Redis, PostgreSQL, Docker, Webhooks, CI/CD

- Built developer tooling that subscribes to failed GitLab pipeline webhooks, pulls merge request metadata, changed files, build logs, and test output through GitLab MCP, and creates a short failure report for the engineer.
- Used well-defined agent skills for repeatable steps such as log parsing, failure classification, patch suggestion, validation reruns, and PR comments, reducing the manual work needed to debug common build failures.
- Added PostgreSQL-backed status tracking and audit logs for failed builds, suggested fixes, validation reruns, and engineer actions so teams could review what the tooling changed and why.

Engineering Standup and Workstream Dashboard

Skills: React, TypeScript, Node.js, REST APIs, GitLab Issues API, GitLab Merge Requests API, OpenAI API, PostgreSQL, Redis, Webhooks

- Built a full-stack standup dashboard that pulls GitLab issues, merge requests, pipeline status, blockers, stale tickets, and recent updates into one React interface for daily engineering check-ins.
- Used LLM summaries and structured prompts to turn GitLab issue and merge request activity into concise team updates, highlighting delayed tasks, repeated blockers, missing owners, and sprint risks before standup.
- Added scheduled sync jobs, Redis caching, and per-engineer and per-sprint views so teams could review current status without manually checking GitLab issues, merge requests, and pipelines.

Conversation Search and Summarization Engine

Skills: Node.js, TypeScript, Express, OpenAI API, Embeddings, Vector Search, MySQL, Redis, React, Redux Toolkit

- Built natural language search for high-volume conversation threads, helping users find decisions, blockers, and action items without relying only on exact keyword matches.
- Added LLM-based thread summaries on top of existing MySQL message storage, using Redis caching to avoid repeated API calls for frequently viewed conversations.
- Built React and Redux Toolkit views for search results, summaries, and thread context so users could quickly understand long conversations without reading every message.

EDUCATION

University of Texas at Dallas

Master of Science in Computer Science; GPA 3.88/4.0

Richardson, TX

August 2022 – May 2024

Manipal Institute of Technology

Bachelor of Technology in Computer Science; GPA 9.02/10.0

Manipal, India

August 2016 – July 2020
